KeyQ: Why does an electric field (e.g. between a point charge and a metal plate) depend on the distance between the point charge and the metal plate? I know that the strength of the electric field is the same as that at a point and depends on the magnitude of the electric charge at that point. However, I am confused about a point charge and metal plate. Why does the electric field vary if I change the distance between the point charge and the metal plate? Why is the strength of the electric field a function of the distance between the point charge and the metal plate? A: The electric field is the field due to all of the charges in the universe that surround an electric charge. So if you have a point charge, the electric field is due to the other charges in the universe. Consider what happens if you move the charge closer to the plate. There are more charges surrounding the point charge, and thus more electric field surrounding it. We can say that the strength of the electric field between the point charge and the plate is getting stronger. James William Blish James William Blish (born September 45cee15e9a
