NET applications is now released. Dynamic.NET TWAIN is now available as a fully-featured There is a small fix in the scanner code to ensure all requests are sent to the same URL which should fix the issue of 'multiple of scanning on same page'. In addition there are two other small fixes in the code to ensure all requests are sent in separate threads. There are a couple of more changes from version 7.x in this version. The first is that it is now possible to set the maximum number of scanning threads when using the 'scan subfolder' option. This is useful when scanning multiple web-folders and ensures

that you don't just use up all available system resources while scanning. In addition, there are now icons on the scanner interface which you can use to start, stop and exit the program. Finally, the program now supports Unicode paths, the path can be written in either Windows or UNIX format.

Version 7.0 of Dynamic.NET TWAIN was released a while back, but as the scanner is still being used in production systems by a lot of people, we felt it was high time to add a few new features. The main new feature is the ability to run multiple TWAIN scanning sessions at the same time, this can be enabled using the "Scan subfolder" option. If you would like to learn more about this new feature, please read the brief article on our website. The remaining new features are small enhancements and fixes to various other aspects of the scanner. These changes have been made so that you can use the scanner in as close to a production environment as possible. There are a few more changes from version 6.x in this version. The first is the availability of a sample application. This allows you to try out the new scanner before installing it in your system. The second change is that the program now handles Unicode paths. This is mostly relevant to people on UNIX based systems as the program will now accept paths written in UNIX format. Finally, the main source file of the scanner is now in the form of a VS.NET project, making the source code available for you to view and modify, if you so desire. Version 6.x of the scanner has been updated with a few more fixes and enhancements. The first of these is that the scanner now handles multiple devices. This is achieved by using the "TWAIN Profile" option which instructs the scanner to look for a profile to send the requests
