[1]Q: PHP: How to sort a multi-dimensional array that contains objects of the same class into another array I have an array that contains objects of the same class. Each object is a week's worth of data and contains information about that week. Each object (which contains the week data) has a parent. E.g.: \$week1\_obj = \$week1\_array[1]; // week1\_array contains two week data objects (containing the data about that week) \$week2\_obj = \$week2\_array[1]; \$week3\_obj = \$week3\_array[1]; The parent is the month of the week (1 = Jan etc.) I know how to pull the week objects out of the array, and then sort into another array. \$week\_array = array(); foreach(\$week\_array\_list as \$week\_array) { \$week\_array[] = array( 'week' => \$week\_array[0], 'data' => \$week\_array[1], 'parent' => \$week\_array[2] ); } array\_multisort(\$week\_array, SORT\_DESC, \$week\_array); What I'd like to do is sort the weeks into each array so each array would be in ascending order by month. I'm not sure how to do this. For instance: \$week1\_array = array( \$week1\_obj, \$week2\_obj, \$week3\_obj ); \$week2\_array = array( \$week2\_obj, \$week3\_obj, \$week1\_obj ); \$week3\_array = array( \$week3\_obj, \$week2\_obj, \$week1\_obj ); Each array should be in ascending order by month. E.g.: 3ef4e8ef8d
