[1]No book on Islamic art would be complete without a discussion of its doctrinal source, al-Hamadhani, who is considered a major transmitter of the discipline to Syria. [3]The only documents that have survived the carnage of recent years in Syria are the ones of the Ministries of Defense and Foreign Affairs; however, they were written only from the mid-18th century until the mid-19th. [4]This is the traditional method of copying calligraphy and painting on stone. [5]To this day, the 14th-century Mamluk-era inlays of the Mosque-Madrassa-Sa'adiya (across from the Gülhane) are still of the utmost beauty. [6]According to Syrian and Syrian-American artistic historians, the time period between Al-Azhar and the European Renaissance (i.e., the time of al-Hamadhani) was one of the most prosperous eras in terms of the dissemination of humanist ideas and developments. [7]This is a practice that has its origin in antiquity; however, it was not necessarily practiced in Damascus, as the practice grew increasingly common in the Umayyad and Abbasid courts. [8]For more on this topic, see my companion work, 'The Old Man of the Mountain: How Wealth, Authority, and the Cult of the Prophet Abused Muslim Art in the Late Ottoman Empire' (forthcoming from Oxford University Press in 2013). [9]Today, the museum is known as the Museum of Antiquities and Munch Museum of Sculpture; it was formerly called the "Imperial Antiquities Museum." [10]The text reads: "Miserable is he, the one who changes a verse of the Qur'an for a paltry sum; indeed, he is a liar and hypocrite." [11]Interestingly enough

A: Can you use as a base? They have ready-made blog posts. Q: Expressing that elements are "taken by" (a function) in the formalism Let's say I have a function $f(x)$. Is there a way to say that " y is taken by $f(x)$ " without any ambiguity? I know that this would be "taken by" or "defined by". What is the appropriate term? A: You may use either "defined by" or "defined to be" (depending on the situation and how you want to phrase it). For example, say we have a function $f(x,y)$ which is given by: $f(x,y)=xy$ Then you may say either of the following, depending on the context: Defined by $f(x,y)=xy$ Defined to be $f(x,y)=xy$ I have written "to be" in the example, but the meaning is the same for "defined by". A famous function (even in math courses) is $f(x)=x^2$, and you may define it using either of the sentences above. The second sentence is also equivalent to "Defined by $f(x)=x^2$ ".

Antibodies are desirable agents for immunotherapy or passive immunization. They have great therapeutic utility for the treatment of a variety of diseases, including infectious diseases, autoimmune diseases, diseases involving unwanted protein expression, and cancer (see, e.g., Adair et al., 2003). The therapeutic potential of antibodies as drugs has been highlighted by their recent success in marketing. Vaccination with anti-interleukin-6 antibodies was shown to prolong the survival of mice with chemically induced cancer (see, e.g., 2d92ce491b
