Q: React/Immutable.js: what is the right way to create immutable data structure Trying to use Immutable.js for my app. I see several ways to create immutable data structure: `var immutable = require('immutable')` `var immutable = Immutable.fromJS()` `var immutable = Immutable.fromJS({ name: 'awesome' })` When to use this method? I use transpiling to ES5 for now. What is the right/better/recommended way of doing this? A: I wouldn't use Immutable.js from Javascript. For simple immutable objects I'd define immutable.js class, like this: `//helper's class var immutable = { empty: function(){ return Immutable.Map({}); }, map(fn){ return this.empty().set(this.get(),this.getIn([0])); } }; //creating immutable data structure var Mutable = (function(){ //creating constructor var instance = function(data){ var newData; if(data){ newData = new Immutable.Map(data); } return new`
