I need to know how to save all this data after the user exits from the website. I have a website where users can post questions and answers, and I have a few questions: Which database would be the best for this data, and how can I create a table for my data? Can I just save the data (the post and the answers) to the root, or should I store them in a database and get the information through a query? How do I do that? Is there any framework (if I use Visual Studio) that can help me? A: Yes, there are a few: ADO.NET Entity Framework (EF) NHibernate Cloning of bacteriophage lambda genes by in vivo transposition of DNA into an in vitro constructed plasmid. A plasmid, pLys, which contains a Sall fragment of lambda DNA covalently linked to a 1.5 kb PstI fragment of lambda DNA, was constructed in vitro by ligating and digesting a Sall-PstI fragment of the pBR322 plasmid. The Sall-PstI fragment of pLys is stable as a 1.5 kb PstI fragment after several hours of growth of E. coli in the presence of exogenous DNA. This in vitro constructed plasmid was used as a "transposon" to facilitate the cloning of a 1.5 kb lambda DNA insert and its deletion derivatives in E. coli. In vivo transposition of DNA into pLys resulted in clones containing the 1.5 kb insert. These clones had deletions of the E. coli sequences present in the insert. Comparison of the toxic effects of alkali metals and organic acid anions on an anaerobic sludge. Anaerobic digestion is important in many bioremediation strategies, but it is not f3e1b3768c
