

External links Category:Indian films Category:2000s Hindi-language filmsQ: Confusion about make, make_shared and new I'm getting stumped trying to write an efficient make function for one of my projects. I've done a number of searches trying to figure this out and haven't really found anything of help. I have a simple class: class Logger { friend class Factory; public: Logger(); ~Logger(); void print() const; private: std::ofstream m_logger; }; I have created a factory class to help with objects of this class: class Factory { public: Factory(); ~Factory(); Logger* create() const; private: std::ofstream m_logger; std::ofstream m_file; std::ofstream m_error; std::ofstream m_warn; std::ofstream m_info; }; Which I want to use in a third class: class Program { public: Program(); ~Program(); void print() const; private: Factory m_factory; Logger m_logger; }; In the Program class I want to call a make function that creates one of the factory objects, checks if it's done and returns a Logger object if it's done. So I tried: auto factory = make_shared(); Logger logger; factory->create()->print(); But I get a compile error on the create function:
