We also offer a free web app. -jakestein . . 6" Q: What's the difference between "cat" and "echo"? I got a question, in Linux, what is the difference between cat and echo? cat \$file echo \$file Which command is more convenient to use? A: The cat program does not actually read the file, it just displays the contents on the standard output. echo does read the contents and write the result to standard output. It is generally not useful for viewing the contents of a file. It is often useful for displaying the contents of a variable: \$ echo foo foo \$ echo "\$foo" foo Unlike echo, cat is more useful for viewing the contents of a file than for displaying the contents of a variable. In particular, cat accepts filenames on the command line as well as variable values. Example \$ cat foo foo \$ cat foo bar foo bar A: In a Linux shell (bash), echo is built-in to bash. In other shells, such as csh or sh, you'll have to specify the shell you're using. cat \$filename is a bash specific thing. It's used for viewing a file. echo \$variable is just an ordinary command that executes the contents of a variable. cat \$filename and echo \$variable are sometimes used to print out the content of a file or a variable in a shell script. One might do something like: cat \$foo | grep \$bar in a bash shell script. But you have to be aware that the results will depend on whether or not that file or variable contains a newline character. The Supreme Court on Monday accepted a plea by the Maharashtra government to set aside its order and reinstate licences for 11 lakh farmers to sell onion in the state. The matter is expected to come up for hearing by the apex court next week. The Maharashtra government has said it would implement the order of the Supreme Court on a "voluntary basis" and decide on whether to continue the licences after a meeting with the onion sellers' association. 2d92ce491b
