In particular, there are certain surgical procedures that require the surgeon to gain access to a surgical site within the body by passing the tools through small opening within the body, where the tools themselves are long and rigid. Recently, "Hook-and-Loop" fastener systems utilizing detachable fastener strips have been used to secure the tissue holding elements to the tissue of the patient. The system comprises a flexible base having a number of apertures arranged in a transverse configuration. The apertures are adapted to accept the detachable fastener strips. The strips can be received within the apertures in any convenient sequence, and fastened to the base to form a tissue holding element. For example, one or more detachable fastener strips may be placed over the flexible base and the remainder of the strips inserted through the base with the fastener ends disposed in open apertures. The remainder of the strips are then drawn through the base, such that the fastener ends retain their position relative to the base. During or after attachment of the strips the base may be wrapped about the tissue in any convenient fashion to secure the strips. Laparoscopic surgery has greatly advanced the development of surgical instruments, and has made smaller incisions necessary to perform surgical procedures feasible.
