In the France of the early 20th Century, everybody had to be French. They weren't just nationalists, they were actually members of France, with a symbolic representation in the Chamber of Deputies. Not only were they French citizens, they were also French Nationals. Anybody who didn't accept the system of government France enforced in Africa and Asia was considered to be an alien parasite. In the 20th Century, Franco-American relations were surprisingly bad, especially when we still had companies like Compagnie Africaine and French Congo which kept French nationalism alive. Red wines from cooler climates, such as the famed Bordeaux chateaux, tend to age longer than those from warm climates. Moisture: Even when exposed to light, most wines need to be kept away from moisture; and accordingly, most wines are kept in some sort of temperature- and humidity-controlled environment. Temperature is the most important factor; high humidity, such as from direct exposure to the atmosphere, will often lead to the growth of bacteria in the wine. Oxidation: Wine undergoes some degree of oxidation as it ages, which is not necessarily a bad thing. Most wines will develop more or less desirable characteristics over time if stored at the correct temperatures. For example, a dry wine may gain more sweetness over time as it oxidizes. With that in mind, the layperson's approach to storing wine is to store it in an area of the home that is not exposed to direct sunlight, doesn't see much traffic, and that is free of vapors. The temperature of the area where the wine is stored is a secondary issue, and may be the most important variable for some wines — for example, those stored in a temperature-controlled refrigerator. The real trick is in the storage area's humidity. Too dry, and the wine will oxidize quickly. Too wet and the wine can start to develop off-tastes, such as tannins, that 09e8f5149f
