The building components feature of AutoCAD is a feature allowing users to draw building components, where each component can be placed individually, is placed, or rotated or translated relative to the rest of the model. They are placed using standard input methods such as the "drawing window" or in drawings. This can be used to achieve a simplified design or to develop plans and

drawings. Text styles Text styles are a part of the text design feature of AutoCAD. They include information such as font, font size, background and font color. They are used for graphic production such as posters, labels, plans and books. Text styles are also used to give presentation documents their appearance, to be found at: Controlling text styles Clipping Clipping is used in AutoCAD to limit the viewable area of a drawing to those objects that are in the current viewport or in the current clipping path. The viewport is a border around the viewable area of the active drawing. The clipping path is an area in a drawing where objects that intersect that area will be clipped away, thus changing the view of the model. Clipping is often used to control the view of a drawing such as for planning and designing buildings. It is often used to limit the view to just the model or a subset of it, for example to limit the view to the model's exterior, to the model's 5b5f913d15
