Periodontal diseases, which include gingivitis, periodontitis, and resorptive periodontitis, are due to chronic and recurring inflammation of the gingival and alveolar connective tissues. Thus, periodontal disease is believed to be the cause of systemic diseases such as cardiovascular diseases, rheumatoid arthritis, diabetes mellitus, and preterm low birth weight. Epidemiological studies have shown that periodontal diseases are closely associated with gastrointestinal diseases, including gastritis, gastric ulcer, duodenal ulcer, gastroesophageal reflux, and liver diseases. Moreover, several studies have shown that periodontal disease is a risk factor of gastrointestinal diseases. The association between periodontal disease and gastrointestinal disease is attributed to an oral route of the pathogenic bacteria and their products through the local tissue damage of the oral cavity, which is caused by periodontal diseases. Thus, it is believed that the outcome of periodontal disease should be used as a factor for predicting the onset of the systemic diseases./ * * This file is part of the SDWebImage package. * (c) Olivier Poitrey * * For the full copyright and license information, please view the LICENSE * file that was distributed with this source code. */ #import "UIImageView+WebCache.h" #import "objc/runtime.h" #import "UIView+WebCacheOperation.h" static char imageURLKey; @implementation UIImageView (WebCache) - (NSURL *)sd_imageURL { 4bc0debe42
