Gaucher disease: therapeutic trials with chaperone inhibitors. Gaucher disease (GD) is a heterogeneous, autosomal recessive disorder that results from glucocerebrosidase (GC) deficiency and accumulation of glucosylceramide (GC) in the lysosomes of multiple cells. The disease is characterized by hepatosplenomegaly, anemia, thrombocytopenia, neuropathy, and psychiatric features. We conducted clinical trials in patients with GD involving the therapeutic administration of the GC chaperone inhibitors, imiglucerase (Cerezyme) and velaglucerase (VPRDase), to examine the effect on Gaucher cell burden and on splenomegaly and hematologic parameters. We also assessed the effect of therapy on disease outcome, quality of life, bone density, and adverse events. The results of the study demonstrated that GC chaperone inhibition with either imiglucerase or velaglucerase resulted in significant reduction of the GC chaperone levels and GC activity in patient tissues. Administration of either imiglucerase or velaglucerase resulted in a significant reduction in tissue GC burden and was associated with stabilization or improvement in the platelet count and bone density and a reduction in the splenomegaly and hepatomegaly. Unexpectedly, we observed the development of transient milder thrombocytopenia and neutropenia in most patients. Overall, the study demonstrated that administration of imiglucerase or velaglucerase was well tolerated and resulted in stabilization or improvement in the parameters associated with the disease.Q: Create a function that looks for specific location of items in a text file I have been making a program that would be able to find every location of an item with a specific text. The problem is that my function is returning the wrong value (1 and 5 should be replaced with 3 and 4), so I have no idea how to fix it.

Reads a given.odt file and converts it to.txt format. License: GNU General Public License - is the best in-hospital reperfusion strategy for ST-elevation myocardial infarction (STEMI)? Rationale and design of the OASIS-5 study. In-hospital reperfusion therapy for ST-elevation myocardial infarction (STEMI) may improve outcomes. The OASIS-5 trial will evaluate the impact of the best in-hospital reperfusion strategy after STEMI on clinical outcomes. OASIS-5 is a prospective, randomized, open-label, controlled study. It will enrol patients admitted with STEMI from April 2013 to September 2014. Patients randomized to the control arm will have conventional reperfusion therapy (fibrinolysis or primary percutaneous coronary intervention (pPCI)), and patients randomized to the treatment arm will be managed according to the best in-hospital reperfusion strategy, which will be decided on the basis of physiological and clinical variables according to current hospital guidelines. The primary endpoint is cardiovascular death or non-fatal myocardial infarction at 1 year. If the best in-hospital reperfusion strategy has proven to be a viable strategy to reduce the risk of in-hospital and 1-year mortality, a multicentre, international clinical trial could be initiated, with randomization between the best in-hospital reperfusion strategy and pPCI as primary therapy in the OASIS-6 study.Q: hibernate the same object is being persisted with different values I have a class named User using hibernate mapping. @Entity @Table(name = "Users") @Getter @Setter @EqualsAndHashCode public class User implements Serializable { @Id @Column(name = "user_id") @GeneratedValue(generator = "increment") private Integer userId; @Column(name = "username") private String username; @Column(name = "password") private String password; @Column(name = "first_name") private String first 09e8f5149f

Converts ODT documents to plain text without external manipulation Key Features: Fast conversion: converts ODT documents in a short amount of time Converts documents in an acceptable manner: the text of the source document is present in the output document Supports long text lines: they are wrapped Supports XML output: saves the document in the same format as the original document, but places it in a different location Views copyright and version information Runs on all operating systems and all versions of the OpenOffice.org suite How to Install: Download the zip file Double click on the .exe file Follow the on-screen instructions Technical Notes: Despite its lightweight and ease-of-use nature, odt2txt does require some technical knowledge about the tool's internal workings. It doesn't offer default tools that a user can use to modify his text content, which leads to the request that you take the time to run the tool's settings to know how to operate and configure it. The following settings control the most significant aspects of conversion: Do you want to print out the converted document? (Note that you can't change the location of the output file from where you started running odt2txt). Enabling (or disabling) the option to open and view the XML file Do you want to view the copyright and version information? (Note that you can't add new entries to the XML text.) Selecting the locale option Enabling the preference for wrapped text lines and every other conversion setting The output XML text is the only text file you will find in the tool's executable folder. It contains the converted document, and also has the name of the original document (to prove that the conversion did indeed happen). odt2txt Tips: You can customize the output file name by adding a / at the end of the converted text (e.g., odt2txt /oclient/home/user/file.odt -t Document1.txt). You can also add a /_ or /_~ appended to the file's name to rename the converted document to a different name. When odt2txt produces an error message, the text is highlighted and placed under the title of the message (e.g., Error message). In that case, you can click the "Show"
