KEYMACRO is a desktop application that lets you save, edit, and apply macro language in any Microsoft Windows application that supports macros. It is a multi-platform application that supports 32-bit and 64-bit Windows. Besides providing you with a wide range of powerful commands that can be combined and arranged in different ways, KEYMACRO can save your time by not requiring any additional efforts to prepare a macro. It can be used to increase your productivity on the web and save your time while working in many Microsoft applications, including Office, SQL Server, Access, and Excel. KEYMACRO has four basic macro functions, and with it you can automate common tasks in the programs you use on a daily basis. For instance, you can easily insert or change a text string in any kind of text editor by pressing a single hotkey combination. And if the text you need to insert is not available in the editor, you can get around it by pressing the same hotkey combination in the application you are currently using. When you need to automate a long or repetitive process, the macro recorder option can be extremely helpful. Using this feature, you can record any step of a process in a sequence of steps and use it later on. Thus, you can speed up your work by recording the steps you need to perform and replaying the process when you need it. KEYMACRO saves your time by improving your productivity and not only by letting you save hotkeys. You can also use it to manage your macros, so as to access them without having to open the program you are currently using. KEYMACRO is free for personal use, and it comes with a few limitations. You cannot save macros in the built-in menus of applications. If you need to create macros for a wide range of applications, the program may need more memory than expected. However, it is a powerful utility that can help you save your time and improve your productivity on the web, and it is compatible with a wide range of Microsoft applications.
