Analyzing traffic with the help of Web page statistics is one of the most important parts of improving and managing any site. This is also an important part of search engine optimization services for ecommerce. How are clicks and traffic numbers calculated by search engines? What do they mean? And how can they be used in order to improve web traffic? The important thing is to have a clear understanding of how search engines calculate traffic numbers to help you make more informed decisions about your websites. Now, not all webmasters may be interested in the details, since they just want to know how many visitors they will have for the next month. All this is usually done automatically by search engine software. Often it's the first time they've heard of the term web traffic though – until now. They may think this is just the number of visitors to a particular site. Web traffic data can also be useful for webmasters who want to learn more about their site before launching a marketing campaign. What are the Web Statistics? Every website has both the inbound and the outbound traffic. Traffic from search engines and from other websites to your website. Both aspects are important, but traffic from other websites refers to what people search for and find when they visit your website. The outbound traffic data is generated automatically by most web browsers, but search engine statistics involves manually submitting a query on a search engine such as Google, etc. The browser sends a request to the search engine, which responds with a page containing the results. This is called an inbound request. There are many different types of web traffic data. It is also possible to measure traffic sent by email, social networks and direct links. Of these, the search engine statistics are the most popular. At any given time, a website's inbound traffic is different from its outbound traffic, as some information may not be available to the search engine that performed the actual request. Web traffic statistics are tracked and displayed on a daily basis. Site statistics, traffic numbers and search engine rankings A search engine always has more than one web page on a specific topic. It can be a company's home page or one of the many that deal with one specific theme. Every web page contains a title, heading, menus, tables, photos, and links. The number of times a specific web page is visited is known as the number of visits. Most people know that search engines are one of the most important ways to get good traffic

UniConvertorLack of mitogenicity of antibodies to T-cell epitopes of circumsporozoite protein in athymic mice. Antibodies to the circumsporozoite (CS) protein of Plasmodium knowlesi (PkSP1), a species commonly used to study antibody-mediated immunity, contain a sequence of 20 amino acids (12-23) of the CS protein. We used recombinant antibodies to this sequence in ELISA and Western blotting of native CS protein to determine the epitopes of the antibodies. Using rabbits immunized with this sequence, we obtained strongly positive ELISA reactions with the CS protein of PkSP1 (92% of mouse Pk antigen), PkSP2 (87% of mouse Pk antigen), PkSP3 (87% of mouse Pk antigen), and PkSP4 (100% of mouse Pk antigen), but negative ELISA reactions with PkSP5 (76% of mouse Pk antigen) and PkSP6 (56% of mouse Pk antigen). We also obtained positive Western blotting reactions with CS protein of PkSP2, PkSP3, and PkSP4 by using recombinant antibodies. Nevertheless, antibodies to this sequence were not mitogenic for peripheral blood mononuclear cells of mice immunized with monospecific anti-mouse IgG to the specific sequence of antibodies, showing that this antibody sequence does not induce positive proliferative responses.!![medphysj68594-0066](#sp1.580) !![medphysj68594-0067](#sp2.581) !![medphysj68594-0068](#sp3.582) !![medphysj68594-0069](#sp
