FIG. 7 shows a general structure of an optical disc drive device. In this figure, a swing-type optical disc drive device 50 is illustrated. This device 50 is mounted to a cabinet 6 and used as a component of an information processing apparatus, such as a notebook computer or a personal computer. A casing 3 of the device 50 houses various drive mechanisms, such as an optical pickup unit 4 that reads information recorded on the optical disc, a main motor 5 that rotates the optical disc 1, and a loading mechanism 8 that causes the optical disc 1 to be loaded onto a turntable 9 and rotated. The main motor 5 and a sub-barnet motor 7 used to drive the loading mechanism 8 are housed in the casing 3. The casing 3 is movably mounted to the cabinet 6 by means of a support bracket 7a. The optical disc drive device 50 is provided with a push-button 11 to be operated by a user. The push-button 11 is located on an operation panel 12 that is mounted to the cabinet 6 and is provided with various kinds of switches, lamps, and various kinds of indicator devices. The optical pickup unit 4 is movably mounted to the casing 3 by means of a first support arm 13. When the optical pickup unit 4 is located close to the optical disc 1, the optical pickup unit 4 is pushed by a support lever 21 located at the tip of the first support arm 13. As a result, the optical pickup unit 4 is lifted to the vicinity of a tray 15 and the tray 15 is caused to move downward. Subsequently, a shutter 2 provided on the tray 15 is opened to face the optical disc 1. A driving gear 16 is provided on a cam plate 14 that is mounted to the main motor 5. Driving force of the main motor 5 is transmitted to the driving gear 16 through a timing belt 17 that is wound around a pulley 18 and a pulley 19. When the driving gear 16 is meshed with a driving gear 24 on
