The software you select is then installed. iPortal is great for quick installations and troubleshooting. You may install and un-install additional software easily without having to reboot your computer, and it can be used to install and uninstall iSeries software. iPortal Description: iPortal is an easy to use Java Webstart application that provides an interface for your iSeries software. It's is an easy to use application that provides an interface for your iSeries software. Requirements: · Java Runtime Environment 1.4+ Is it Possible to Generate an Ad-Free JAVA Webstart Application without using Java Webstart Plug-in? Does anyone know if it is possible to generate an ad-free JAVA Webstart application without using the Java Webstart Plug-in? If someone answers please, then let me know. Thanks. JavaWebStart is a set of APIs that provide the foundation of a Java Webstart application that uses the Java Runtime Environment to start a local execution environment. This code can be used with any Java-enabled application, no matter how complex. It's an easy, no-fuss method of executing applications. There are three main aspects to JavaWebStart: the usage of Java WebStart to start applications, the mechanism used to delegate user interaction to Java applications, and the "user interface" provided to the user. JavaWebStart is the Java Runtime Environment's way of starting applications. As an application runs, the code to be run is passed to the Java Web

What's New in the?

JFirewallTest is a Java based Webstart application designed to test for the open ports on your firewall. Unlike other solutions, JFirewallTest is a two stage testing procedure that tests all 65,536 ports very rapidly. After testing is complete, JFirewallTest will present a page of results reporting exactly what ports are open and accessible to others on the Internet. The list includes information about common services associated with each port and an estimate of the vulnerability. JFirewallTest runs on Java 1.4 and above. JFirewallTest requires a minimum of 5Mb of free space in memory. If the Java Runtime Environment (JRE) is not 1.4+, it will display an error message and refuse to run. Key Features: ·Two stage testing procedure that tests all 65,536 ports very rapidly. ·No false positives. JFirewallTest will report any open ports you might expect to be open but not expose to the Internet. ·An online display of all results after testing is complete. ·An online display of information about all open ports including information about common services associated with each port and an estimate of the vulnerability. ·Version 1.0:

System Requirements For JFirewallTest:

Supported OS: Windows 7/Vista/XP/2000 Drivers: Recommended Requirements: Drivers Languages: English English
