Make groupware-based backups Manage media collections Share files with other users Easy to install and configure Option to limit the transfer speed User-friendly application Support for Linux distributions Some may feel that the interface could use some work to make it more attractive. In other words, Seafile is a feature-rich application but it does not offer the same level of user friendliness as similar services on the market. There are some drawbacks to mention as well. We have found that when using the application you need to set up firewall rules with some access rules for the employees so that the information is not accessible from the outside. As mentioned earlier, the interface is not very appealing and we could not find any documentation explaining how to make it look better. For example, the application opens a folder that you can use to enter the information about the shared files as well as the folders that have been synchronized. Otherwise, there is not much more to say. Simply put, this is an easy tool that offers many options and is usually not too intrusive. Category:Free software Category:Linux file sharing software[Assessment of the functional capacity of spinal cord hemiplegia in rabbits. Part 2. Comparison of ventral and dorsal stimulant treatment]. A 40-day experiment was conducted to compare the functional capacities of central hemiplegia of the spinal cord in rabbits caused by bilateral transection of the spinal cord at the lumbar level L3-L4. The experimental animals were divided into two groups. Twenty rabbits received bilateral spinal cord stimulations from the ventral and dorsal regions. In the control group, 20 animals were treated conservatively, i.e. they were not stimulated. Functional capacities of the experimental animals were evaluated on the basis of walking ability, running ability and the ability of the animals to perform climbing in a bucket. The results of these measurements were expressed in points. It was shown that stimulation from the ventral regions led to a more significant compensation of the neurological status of the animals than stimulation from the dorsal regions. The functional capacities of the experimental animals treated from the ventral regions were higher in comparison with the animals treated from the dorsal regions. The recovery of the animals with hemiplegia of the spinal cord ventral in stimulation from the ventral regions is related to the preoperative neural connections of the ventral horns. This is confirmed by restoration of the ability of performing crawling.Q:
