Basic brush & pattern creation workflow with Flow-into. Adjust it, add specialized shapes and create huge floral arrangements on your own. Even when it comes to creating a non-linear workflow, it can be challenging to create a sequence of steps that ensures an optimal use of the application's capabilities. However, there are plenty of software tools that can make this process smoother and more efficient. Such is the case of Flow-into, a free plug-in for Photoshop that can make the design of more complex shapes much easier. Once installed, it can be used as a part of a more complex workflow that includes the design of a specific type of effect in Photoshop. For example, you can create a floral arrangement by using the tool and then turn it into a

GrowFX allows 3D modeling of fruits of all kinds thanks to an innovative and dynamic algorithm. A novel variable region of hepatitis C virus NS5A. Hepatitis C virus (HCV) is a small, enveloped, single-stranded RNA virus of the family Flaviviridae that has been identified as the main causative agent of non-A, non-B hepatitis, a major cause of morbidity and mortality worldwide. The partial genomic sequences of a large number of isolates have been determined to date, but the size of the variable region of the genome is limited to approximately 200 nucleotides. In this study, the presence of two nonoverlapping variable regions of the NS5A protein in the genome of a so-called cis-acting site (38T-42A) and a trans-acting site (303A-305A) in the core protein was identified. The sequence of the strain HCV(NL1-7) is identical to that of the prototype HCV-2a from the Netherlands. The variable region of the core protein is located in the core-NS2 and NS3 protease cleavage sites. The cis-acting site is present only in the putative nonstructural NS3-4A precursor, which is in agreement with the fact that no cleavage products of the NS3-4A region are detectable by Western blotting. The trans-acting site (303A-305A) is present on the putative NS3-4A precursor but not on the NS5A precursor and NS5A in the mature virion, suggesting that this site is cleaved at a stage during virion assembly or mature virion packaging. Studies of amino acid substitutions on the trans-acting site indicated that the amino acid substitution at position 303 (phenylalanine-->valine) reduces virion assembly. This is

Create and customize plants from your imagination. This is a mesh generator, where you can change and create everything from the basic object to highly elaborated trees. You can create simple objects (planes, cylinders, cones, hexagons, circles, etc.) or combine them together for more complex objects (spheres, oblate spheroids, etc.). You can transform the shapes into different angles, bend them, translate them, rotate them, etc. 2D/3D plants You can create simple objects, planes, cylinders, cones, and any other shape and customize them in any shape and size. Use a plant as a background Create different plants and trees as a background for your scene in which you can create and customize all the objects (planets, clouds, stars, etc.). Create the real-looking plants with specific settings that are optimized for them Start from choosing the plant and set its shape, rigidity, curvature, and appearance. Besides, you can set the plant location and the space you want to put it. Your plants grow using a simulating process. You can change the time to give the plant a particular growth stage and many parameters that affect and change the growth stage of your objects (weight, mass, size, time to change plant stage). The simulation is very precise. You can control each leaf and tree in particular. Watch your plants grow into different shapes and sizes while controlling the growth stage: from the basic growth period with leaves and a sphere tree (with just one branch) to the final stage with fully grown trees and a complete sphere shape.
