History AutoCAD was initially developed by a group of drafters, artists, and engineers called the Garage Technology Group.

They envisioned it as a desktop CAD program for use by a single drafter, rather than as a multi-user, network-connected program. The original company, which was located in California, had experienced financial difficulties by the end of the 1970s.

It sold its assets, including the rights to AutoCAD, to an outside firm, which then changed its name to Autodesk in 1980.

Autodesk later acquired a California company named Pieper-Tec, which produced a competing CAD package named MicroStation. This was followed by a lawsuit, filed by Autodesk, against Pieper-Tec over trademark infringement. The suit was settled in late 1988 with an agreement that Autodesk would retain ownership of the name MicroStation and that the two companies would collaborate on future products and programs. Autodesk began AutoCAD's development in the late 1970s.

However, because it was too early in the microcomputer era, computer graphics cards were still relatively expensive. Besides, CAD software typically ran on large, expensive mainframe computers. Only in the mid-1980s did inexpensive microprocessors become available and offer enough speed to handle large CAD projects. AutoCAD was first released in December 1982. Since then, Autodesk has released several updates and new versions of the software. Over the past 30 years, Autodesk has sold more than 1 million copies of AutoCAD. Function As a CAD application, AutoCAD is designed to allow users to create and edit 2D diagrams and 3D models, and to perform 2D and 3D drafting and assembly operations. Users can also work collaboratively on documents within a networked CAD environment. Like most CAD applications, AutoCAD is not a drafting program in the sense of a design-firm process. Instead, it is more of a tool for drafting. Thus, it can be used to create vector drawings, assembly drawings, and architectural drawings. Since version 20 of AutoCAD, all of these types of drawings can be created. There are four types of basic drawing views that a user can customize. First, a drawing view can be set to a 2D, 3D, or table (for simple

lists of dimensions) format. A second type of view is the default view that appears when you start the program. This

Settings Editor The AutoCAD Settings Editor is a configurable application that runs in AutoCAD, and can be used to manage user and group preferences. It contains a list of settings categories with options that can be applied to multiple documents at once. This allows administrators to create custom user or group templates. Help AutoCAD comes bundled with a help system, both in the form of an application called HelpIndex, and through online resources via the Internet. I've seen numerous LED bulbs that output pure red light (e.g. a Philips 5050 red LED). In this case the device needs to be a monochromatic device with no other color components. Since the device has no other color components and only emits one color, how is it possible to determine its brightness? For example, how is it possible to know how bright the LED is when it is surrounded by a typical yellow glass bulb? A: Red LEDs are typically much brighter than standard incandescent or florescent. As I recall they should be about 40 times as bright, and from a few manufacturers at a peak output of 300 mA (20 mA nominal), and at a rating of 5 V (1.8 V nominal). Incandescents and florescents typically run at about 60-100 mA, and 5 V. The practical effect of the bulbs is that they're brighter than standard bulbs, but they also tend to have a hotter temperature, which causes the hotter emission temperature of the red LED. If you look at the beam from a lamp, you will see that the high color temperature of red means the beam is rather broad, with a bright spot at the center. (Compare this to incandescents, which are much more angular, and have a lot of red in the outer part of the beam). For a rating of 6-10 W power for the standard bulbs you would want to look for a power rating that's  $5\text{ V} * 20\text{ mA} * 40/60 = 2.0\text{ W}$  For the red LEDs you would need to specify a color
