F/XMonad is a generic wrapper around a small set of application that act as a monad for windows, the "windows monad". These applications are responsible for managing various system resources like fonts, cursors, desktop themes, as well as a number of other aspects of the desktop. About XMonad XMonad is a tiling window manager for X11. It is derived from and similar in philosophy to a class of window managers called "wms" (window managers), though the philosophy behind XMonad is to make it so that you can work on one computer (your main workstation) in one window manager, and then use a different computer (an X11 system) to run your computer while you are away (on your laptop, for example). Download XMonad for Windows Getting started with XMonad XMonad contains no wizards, no tutorials, no intro. This may be a problem for someone who wants to get started quickly. However, there is a GUI that can help you get started with XMonad and with your Windows experience with XMonad. In fact, this is the best GUI to get started with XMonad. However, you do not have to download it to run it. To get started with XMonad, download the application. You will get a nice GUI which allows you to configure many aspects of XMonad. You can configure which applications get started at startup. You can configure the desktop layout (the various panels). You can configure the layout of the windows on the desktop. And you can configure the layout of the X windows on the X server. The application is not very intuitive. A brief description of the different configuration options and how to change them is provided in the introduction to the application. You will see a whole list of applications which you can start on your Windows computer. You will see a whole list of applications which you can start on your Windows computer. A complete list of applications and configuration options is available. You can get all information about XMonad in the user documentation. This is the full manual for XMonad. The manual is a free download. To start an application you click on the application in the list, and then you click on the Start button. If you want to start an application, for example, Firefox, from the command prompt, you would type in the following: xmonad & firefox If you want to start an application without any XMonad window, you can also start the application with the following command, and you will see a dialog window, which tells you that the window is starting. If you want to stop the application you can do it with the following command: xmonad Conclusion If you want to get started with XMonad, you have to download the application. It is not as intuitive as XMonad is made to be.
