Nysoft AllShare Finder is a small, easy-to-use Windows utility used to quickly find out which of your digital devices are connected to the local network, including your hard drive. What are the different parts of a network? Simply stated, a network consists of multiple network-capable devices such as notebooks, PCs, smartphones and tablets. With AllShare Finder, you can quickly locate all of the devices connected to your local network and then control them. Of course, you can open a specific device by double-clicking the icon of that device, but you can also open it by right-clicking on the device icon. With AllShare Finder, you can also quickly find out which of your devices are online, and for which resources are they online. You can choose from several options that are available for online and offline devices. What's interesting about the online devices is that they will appear on your network as an additional device, similar to a computer running the AVASTZONE antivirus software. Listed below are a few more of the tools included in this software suite. A Scan is the process of connecting to a network for the first time and configuring the devices to the one you wish to use. More so than most similar software, this program actually helps you find and set up devices on a network and only takes a few minutes to complete. The list of available devices includes mobile devices such as smartphones, tablets, laptops, and even hard drives and printers. What's nice is that it will actually recognize the devices on your local network based on their MAC address, regardless of their operating system. To complete the process, you simply scan your devices on your local network. One example is, if you wanted to scan a laptop, you would enter the laptop's IP address, along with the names of the devices you'd like to have set up. The last of the tools in the suite is the Security tab. This is where you can scan your devices to find the ones that are infected with malware, or simply infected with a Virus. All in all, this is really a solid set of tools, and even though you can import a list of devices, you should also try to open them one by one to make sure that everything is working okay. Speed-O-Meter

If you're someone who's stuck to just one network connection at home or at the office, you know how frustrating it is to deal with speeds that differ significantly from one network to the next. Speed-O-Meter is a good free choice when you want to know if that annoying WPA2 password is giving you a decent speed or not – as long as you don't need it to provide any reliability or security feature at all, of course. What's New In Speed-O-Meter?

Speed-O-Meter is a very simple Windows tool developed to show download and upload rates in real time. Once installed and launched, Speed-O-Meter places an icon in the Windows System Tray that provides access to its features and settings. Basically, it all comes down to a floating graph that can be placed anywhere on the screen in order to monitor a network connection. Sadly, if multiple adapters are installed on your system, Speed-O-Meter doesn't allow you to choose the one you wish to monitor, so it simply selects the one connected to the Internet. The graph design is very simple and only shows download and upload rates, with a "maximum" option to show the highest recorded value. The configuration screen is incredibly limited, allowing you to choose download and upload colors, transparency level and make the app run at Windows startup. Speed-O-Meter works on any Windows version on the market and doesn't require administrator privileges. Furthermore, since it only packs just a small number of features, only basic computer knowledge is required, so it can be safely used by both rookies and those with more experience. All things considered, there is no doubt that Speed-O-Meter is an interesting project, but it simply lacks too many essential features to become a top product in this particular software category. Simplicity is greatly appreciated most of the time, but in this case it all comes down to a few tools and a basic graph showing real-time traffic statistics.
