What's New In UmdReader?

UmdReader is a lightweight application designed to help you open and view e-books in UMD format, often used on mobile phones. UmdReader displays the chapter list for the opened book, together with information regarding the book author, creation date, publisher and vendor. The original source file for this repository is a fresh install of Ubuntu 10.04.2 LTS. This install has OpenJDK 6 runtime installed. LibreOffice 3.4.4 was installed to use this repository. Most of the major and minor releases of Ubuntu are supported, but please check the release notes and the

software documentation for more details on what is supported. I installed the repository and updated everything I think I need. When I go into "Help > OpenJDK > OpenJDK 6" it opens up for about a second, then closes. I have confirmed the openjdk-6-jre-headless is the current version. I can install in JRE, but when I run from the terminal, I get nothing. I tried the current version of UmdReader, but as far as I can tell, the version in the repository is older than I can install. Could the OpenJDK installation be corrupted or something, I don't think it should be that way. I just checked the version of OpenJDK 6: jdk1.6.0_20 Maybe you can download the tar.gz (make an iso with mkiso) and install it from the command line with "sudo apt-get install openjdk-6-jre-headless" I can't install the package at all. The version of openjdk in the repository is 1.6.0_20-b11 while mine is 1.6.0_20-b10. I have a few VMs so I can try them and see if they work. I'll try it here when I have a little time. I can run the program, the only problem I have is that it doesn't remember the previous window position. If I am in the main window and click "Help" then close the help window, then try to open it again, the help window will have the same position as the main window. I am really not sure if this is a problem or not, but I was wondering if anyone has any ideas? Does it work for you? I am interested in how this program works, so any useful suggestions regarding where to look to get this thing working are welcome. Still has that same issue. I did a fresh install of OpenJDK 6 and installed UmdReader on it. When I run UmdReader from the command line (UmdReader) I get the same thing. When I run it from a launcher
