It makes reading fun and easy for parents, and even reading a full story book becomes easier and more fun with Zoom Reading! Just pop the books into the reading device, open the book and read on as the fun narrator suggests the way for your child to read along. There are many of them so choose the ones that interest you! I have been reading the articles about MVVM pattern. I get the basics of it. But I am unclear how the parameterless constructor is used to create objects in the viewmodel. I am attaching a screenshot of the article to make the point. Shouldn't the CLR start the class constructor when you instantiate the object in the view? Can anyone help with a clear code sample? A: In a typical MVVM design, there will be a View and ViewModel. The ViewModel will have a default constructor. From the View: var viewModel = new ViewModel(); When the view clicks something, the ViewModel will invoke an event that the View can subscribe to, and do something in response. Typically, a ViewModel is meant to encapsulate behavior, and not provide a mechanism to create an instance of the ViewModel itself. The xspat keyword has some special properties, which allow you to create active blocks of xspat code which will survive a reload of the page. Say you have a form with a button which should send the contents of the form to a REST service. You want to serialize that form's contents with the OpenPAAS Java library before sending it. This is the behavior you want, however the command line interface puts the commands in the outgoing request body. If you reload the page with XHR headers, the POST body will have all of the serialized data. What you'd like to do is
