Most of the filters are build-in, but some more complex ones are available with the help of a dialog. The functionality of the filters is very similar to other popular dithering filters, like Paper or Keylight, but they do have some differences. The key difference is that the output of the filter is a new image file, which is completely different from the original one. Each filter will have a different result when running. For example, the paper filter will give a new file where the pattern is applied to the original picture. In some cases the original picture will be replaced with a new one. This is because, for example, the cell filter removes the original layer and adds a new layer with a pattern. You can control the result of the filters by changing the settings. Main features: Filter is accessible from the filter panel. The filter can have 2 or 4

parameters. In order to edit them you need to open the dialog and change the values of the parameters. It's a bit of a hassle, but is the only way to make changes to the filter's settings. #### What's New in the Jama 3D?

Jama 3D is a freeware plugin developed for Adobe Photoshop. It's the simplest way to create corrugated and cellular like patterns from 2D images. You can easily make various bricks and herring bone textures. Sequenced filtering produces bizarre unreal deformations of the original picture, crumpled paper effect, etc. Using different 2D shapes on a transparent layer produces complicated 3D border effects. The edge antialiasing option improves the dithering. The filter is extremely compact and accessible. The original Jama screen image that is used for pattern generation is saved in a PNG format. This PNG file is used to create a JPEG file that contains the generated pattern. To create interesting texture patterns, it's necessary to
