What's New in the Veeam Endpoint Backup?

Copyright text 2018 by Proxy IT - At what point is it safe to rename a column in a table? I have a SQL table that contains over 1 billion rows. About a year ago, someone thought it would be a good idea to add another column to the table, but the table is getting updated daily and there is no foreseeable way to tell which rows will need that column. So now we're down to only about 500 million rows with the new column, but our usual tools (SSIS, etc) don't handle such large tables well. We decided to try some new tools. The new tool is a distributed cluster. To reduce the load on the cluster, we were going to name the new column like the old column but with a different number (e.g. column 2). So we renamed the old column to column 2. The new tool did its initial load without error. However, when we did our first load after making the column change, it was slower than usual. We checked the table and saw that it had renamed the column back to column 1. We restarted the distributed load and it took about the same amount of time as before, which is acceptable. We did our first load, and it took about the same amount of time as before. Next week, we do a second load, and the table is already slower. We check the table and it is still renamed back to column 1. We restart and it takes about the same amount of time. I do a third load. This time, it's slower than usual, which tells me that it thinks the table is being renamed. Is there any real danger to me from making this change? What should I do to avoid this problem? Is there something that I can do before I make this change? A: If you have a sufficiently large backup that you can restore on the same day you did the change, then I'd suggest you try: `RENAME TABLE mytable TO mytable_bak; RESTORE DATABASE mytable FROM mytable_bak;` You should find that the restore completes in about the same time as your loads did without the problem, but if you need to back up the table again, you can get back to having it as you started with: `ALTER TABLE mytable_bak RENAME TO mytable;` When you make a permanent change like this, you want to make sure you have a backup of the table before you make the change. If you

want to use a distributed cluster to load, it's often wise to make a second, smaller table on a different server and synchron
