CryptFile is a software tool to encrypt or decrypt files and to compress files. It uses the 2-stage password to encryption or decrypt files. It uses the user's own password or another password generated by itself as the 1st password to encrypt or decrypt the 1st password. The 2nd password is automatically generated when the user encrypts or decrypts the 2nd password. After successfully encrypting or decrypting the 2nd password, it checks to see if the 2 passwords match. If they match successfully, it deletes the temporary password files which is used to encrypt and decrypt the files. If they don't match, it starts a new trial and saves the file name again. It supports the x, y, and z stages of encryption or decryption. The other stages are auto-generate or do not need any user input. The 2nd stage password is not required after the first stage is set up. After the first stage is completed successfully, the program automatically generates the 2nd stage password.
