Photoshop CS6. Layers In Photoshop CS6, layers are used to create additional subregions that offer greater control over the image and work with other layers. Layers exist in the Backgrounds and Layers dialog (CS6 only). Layers are described in more detail in the following sections. The ability to create, name, and organize layers is one of the most important features of Photoshop. The Main Menu contains the Layers panel and Layer Tools panel, providing easy access to all layers. Figure 6-1 shows the Layers panel, which is located on the right side of the image window. You can use the Layers panel to control the visibility of individual layers, move layers up or down in the layer stack, delete layers, duplicate layers, and so on. You can open the Layers panel by selecting View → Layers from the menu. Alternatively, you can press the spacebar to display the panel. Some tutorials recommend naming layers with sensible names. For example, you may want to name one layer "Head" or "Skull," and another layer "Face." This way, you know exactly what part of your photo you have incorporated into the layer and what its purpose is. Layers are logically organized in the Layers panel. Any layers you create are grouped within the Layers panel by type or category. (The list of layers in a category is displayed in the layer panel). In Figure 6-1, the figure shows three layers: "Foreground," "Group A," and "Group B." As a general rule, you create the main subject of your image in the Foreground layer and the objects or compositional elements such as the clouds or sky that contribute to the main subject in another layer. For example, an image of a rainbow and the sky in which it appears will usually be organized so that the rainbow is in the Foreground layer, and the clouds and sky are in the layer called Cloud. If you want to show a transparent background layer, place it on the Layers panel between the Foreground and Background layers. By doing so, you can see the entire image through that layer. Layers also have an RGB layer mask (color negative). The RGB layer mask is a handy tool that enables you to selectively mask out portions of an image so that you can change the area without modifying the rest of the image. Take a look at the below sections to see how to organize your layers

Demonstration of a radioimmunoassay for human growth hormone with fluorescence-labelled antibodies. A radioimmunoassay has been established for the quantification of human growth hormone in serum and plasma with highly purified iodine 125-labelled monoclonal antibodies. The assay exhibited excellent precision and sensitivity. The value of the assay procedure is briefly discussed. It is concluded that the radioimmunoassay method provides a highly sensitive and precise means of quantifying human growth hormone in small volumes of human sera and plasma.[Purpose and limitations of the PER model in real-life as an anaesthesia simulator: a questionnaire to dentists]. Real-life simulation (RLS) is a technique to develop and test a new instrument or a new technique for anaesthesia, using a mannequin instead of a patient. The present study aims at evaluating the general acceptability and usefulness of the PER model. A survey was performed by postal mail during a three month period. Participants asked to complete a questionnaire concerning the principal characteristics of RLS and PER, considering its usefulness and its interest. Results were compared to those of the literature. Between May and December 2006, 135 questionnaires were sent to RLS users. The participation rate was 86.8%. Four groups were distinguished: 49 per cent of participants adopted RLS only to test an anaesthetic device; 43.9% used RLS to develop a procedure or technique; 4.5% used RLS only to test an anaesthetic device and to develop a procedure or technique. Only half of the respondents, and mainly specialists in regional anaesthesia, considered that the method was useful. Although the number of respondents from abroad and from "university hospital" was higher, statistical analysis did not reveal any significant difference between the two groups. All respondents believed that the current version of the simulation did not meet the needs of anesthesiologists, mainly in terms of mechanical devices and user-friendliness. PER model is well accepted as a RLS by some anaesthesia specialists and is a recommended model for simulator of equipment or techniques; however, it has some limitations. This study revealed that the PER model has the potential to be a useful RLS in the development of new equipment or techniques for anaesthesia; however, it needs to be improved before it can be used safely in clinical practice.Q: Using a tooltip on a small icon Can anyone help me to use a tool tip for a small image icon.
