Q: What would cause a tape drive to keep spooling tape through a drive, even if it is not attached? My labmate has a laptop with a single hard drive, and attached to it is a tape drive. He recently took the drive out of the laptop, and if it was to be replaced with a new one, he would plug the old drive back in to test it. He found, though, that the old drive keeps spooling tape into it, even though it is not attached to the laptop. He's observed it for several hours, and it appears to be the same state about once every two days. This doesn't seem to happen when the drive is attached to the laptop. Does anybody know of a reason why this might happen? In theory, this could be a design flaw in the USB connector (I doubt it), or a software bug (also unlikely), or even a hardware issue. What I'm most interested in is whether this might be indicative of a poor quality unit. A: The solution to this problem isn't going to be cost-effective, though I'd guess that more than one person and one laptop has had this happen. If the drive is failing, it might be spooling tape as a sort of fail-safe mode. If that's the case, it's possible the drive, at least with some SATA/SSD drives, is running a kind of chameleon software. It works by monitoring its own power supply to determine if it's still plugged in. If it is, it loads data off the drive and runs the app, but if it isn't, it stops loading data. There are a few ways to test it: Send a signal to it. On my machine, this will be a USB reset signal. You can plug the drive back into the computer, and it'll give you an indication via the computer's power/reset light (and possibly via an LED in the drive). Try it with a different cable. I've worked with one PC that wouldn't power up the drive unless I ran it from the computer's motherboard. When I pulled the drive out, the drive kept trying to spool up the tape (even after rebooting) until I plugged the drive back into the computer. The fix was to put a standard molex power connection on the back of the drive instead of this weird chipset connector. It doesn't

Aphidicolin: a new inhibitor of DNA synthesis. 2. Synthesis of various analogues. (+)-Trans-D-erythro-3-bromo-4-hydroxynaphthalene-1-acetic acid (1) reacted in the presence of phenyl isocyanate and HClO<sub>4</sub> to give the alpha-methylene analogues, 17. Analogues of both enantiomers were prepared from compounds 17, 17-trifluoroacetyl, 17-acetyl, 17-methyl and 17-benzyl ester. Various debenzylating reagents were then used to give analogues of both enantiomers. Finally, upon UV photolysis in CH<sub>3</sub>CN/H<sub>2</sub>O(5), the title compound was photoformed in excellent yield and moderate purity. Its structure was assigned by <sup>1</sup>H NMR and deuterium studies. Pigmentation of nail, hallux is a rare phenomenon. The pathophysiology behind the process is not clear. The association with systemic connective tissue diseases has been previously described but there are reports of the condition in the absence of any such association.

Introduction {#sec1-1} ===== The nail matrix derives from dermal papillae that create a specialized, invaginated pedicle into which cells are imported to form the nail plate. Any dermal process in the region of the nail matrix is called ectopic nail matrix in English literature. The most common of these processes are subungual hemorrhage, trauma, pyogenic granuloma, pyogenic granuloma like changes, actinic keratosis, and melanin incontinence.\[[@ref1]\] Ectopic melanin deposition within the nail matrix is a rarely reported phenomenon.\[[@ref2]\] Hallux ectopic melaninosis was first described by Mikaeloff in 1951.\[[@ref3]\] In the English literature, the hallux is the most commonly affected area. The pathophysiology behind the process is not clear. The association with
