Ki-67 expression: a prognostic factor in patients with locally advanced breast cancer. We evaluated the clinical significance of Ki-67 antigen expression as a prognostic factor in locally advanced breast cancer (LABC) patients treated with neoadjuvant chemotherapy. Seventy-five patients (age range, 24 to 86 years; median, 52 years) with stage IIIA/IIIB LABC (24 T2-T4, 42 T3N1-N3) and subsequent curative mastectomy were evaluated. None had received previous chemotherapy. They were treated with standard neoadjuvant chemotherapy. The Ki-67 labeling index (LI) was determined immunohistochemically in fresh biopsy specimens obtained before treatment. Patients were followed up for a median of 10.2 (range, 5.3 to 15.5) years to determine the

---

disease-free and overall survival. Thirty-three patients (44%) had positive Ki-67 LIs before treatment. Patients with positive Ki-67 LIs had significantly shorter disease-free and overall survival times than did patients with negative Ki-67 LIs ( $p = 0.03$  and  $p = 0.049$ , respectively). In univariate and multivariate analyses, Ki-67 LI, nodal status, tumor size, and type of chemotherapy were significant prognostic factors for disease-free and overall survival. Positive

Prediction of turbulent gas expansion on soft polymer surfaces from unstructured conformational sampling by simulations and modeling of poroelastic response in confined cavities. Microscale energy losses of turbulent flows in randomly packed hard particles are quantified and used to estimate turbulent air flow through diffusive porous media (gas or liquid suspensions) for extremely low Reynolds number and large scales. The cross-correlation function of the pressure fluctuations is used to infer the probability distribution function of the dissipative power in the bulk fluid in the case of turbulent free gas flows confined in macroscopic sample volumes. For a given flow configuration and the bulk permeability, different modes of expansion and localized dispersion of the fluid are identified and quantified. The deformation of the confining surface is considered as an inhomogeneous and anisotropic porous medium characterized by either fixed or time-dependent pore size. The latter case is relevant for porous media in which the confinement is imposed by a porous barrier and imparts elastic properties to the confining surfaces. By coupling the power loss probability distribution in the bulk fluid with Poisson statistics of random heterogeneities on the confined surfaces, we predict the average of the dissipative power losses in the bulk fluid. The quantitative agreement between simulations and theoretical results is remarkable, demonstrating the predictive power of the model and showing the dominance of diffusive energy losses over convective contributions to the flow of the gas.

AISI®, 8075 – PN20 Steel Parmesan Nitride Steel AISI 2075 PN20 steel is a commercial quality para-nitro-spiro alloy steel

---

which can be used for: Stress relief High tonnage and high strength Low Pct. (Fe,Mo,C,Si,C(N) and N) Brittle and tough Compact Cold finished We are a Authorized Supplier for all Stainless and Carbon Steels. The products are shipped from our warehouses in Calgary, Edmonton and Vancouver and are available for delivery in 14 to 28 days.
