Aashiqui 1990 Hindi 720p 480p BluRay.Magnetic resonance imaging (MRI) is a very important technology for clinical diagnosis. Large magnetic fields and gradient fields are required for producing high-resolution images. For magnetic resonance imaging, a patient is placed in a large bore static magnetic field and is scanned by an array of gradient coils. Gradient magnetic fields are used to sense the location of the nuclear spins to be imaged and subsequently to excite them to flip over or align in the direction of the applied field. The nuclear spins then precess to produce RF signals that are detected and analyzed to build an image. Imaging gradients are produced by applying current pulses to electromagnetic coils to create magnetic fields across a body. However, as a result of using very large current pulses, a major problem is presented by unwanted resonances that result from the inductance and capacitance of the electromagnet structures. One problem with such inductance and capacitance is that it causes a DC or AC instability when the current is changed. The capacitor and inductance can resonate with the high frequency circuit and produce
