Отзывы All the key and value pairs for the selected text or range are stored in the Metadata table. In order to find the metadata for a specific Key name we offer a Metadata Browser.

This feature is activated from the contextual menu when you right-click on the line above the selected text or range. For example, when the range starts with the string 'AAC'. The Metadata Browser will open

to show a list of key name values (AAC_Artist, AAC_Album, AAC_Track, etc.) and store a value for each. This value should be a 'text list', where each list item contains the actual information. Please note, the metadata browser does not restrict the number of selected keys or the number of list items per key. Each list item in the Metadata Browser will show the metadata for the selected key. For example, when you select an Artist in the list, then click the 'list' button at the right of the selection to show more

details for the selected Artist. You will notice the 'Artist_Name' field is a 'text list' containing the actual Artist name (as stored in the song file). Some metadata values (like Artist_Name) will contain many list items, and may even have a prefix value that is not included in the list. For these values, just select that main list item, and click the 'list' button at the right of the selection to see the list of sub-items. As you can see, there are many different fields in the metadata structure. In order to view/edit any of

them, select the metadata value and hit the F1 key (for help). VidSplitter for Mac is a

Tin Goose Screen Recorder offers you to record your screen activity and save the data to FLV video files which you can directly upload to YouTube or other video hosting service, without the need to convert them first. All you need to do is to choose a recording speed, start a recording and enjoy the video produced by Tin Goose Screen Recorder.

The quality is very good. Installation is a breeze, but is performed only for you directly on your personal computer because the program provides no installation file. Tin Goose Screen Recorder can record screen activity in different ways. We were able to do it manually, with the help of taskbars and shortcut keys, and with the help of Windows Automation. The interface is easy to use and displays options and features in a clear way. The program's help function is well integrated in the user

interface and there is an option to create a tutorial (although this is not necessary). The maximum file size is 2 GB, although some larger files (i.e. larger than 750 MB) may have problems with uploading them to YouTube. The quality of the recorded content is good, although a small portion of the content is lost when recording is done from a large distance or the screen resolution is set to a high setting. Tin Goose Screen Recorder may run slow or extremely slow on older computers (with lower screen

resolutions), but we didn't encounter these problems.

VidSplitter VidSplitter is a software that lets you split video files of various formats, including AVI, ASF, MOV, MP4, MPG and WMV. The interface of the

application is simplistic and easy to navigate through, since you don't have too many options at your disposal. Videos can be imported via the file browser only, since the "drag and drop" method is not supported (and neither is batch processing). So, once you specify the output directory and size (flash drive, CD, DVD or custom), you can proceed with the trimming process. On top of that, you can modify audio and video parameters when it comes to the height, width, frames per second, aspect

ratio, codec, format and others (optionally disable audio). Plus, you can preview the clip. During the conversion process, you can check out the progress of the current file. Once it finishes, VidSplitter offers to open the output folder. The simple-to-use program requires a moderate amount of system resources and quickly finishes a task without freezing, crashing or displaying errors. We haven't encountered any difficulties during our tests and VidSplitter manages to keep a very good image

and sound quality. On the other hand, VidSplitter doesn't offer you other splitting methods. For example, you cannot split videos into a specific number of parts or by marking the start and end time. Also, batch processing is not supported and there is no help file available. We recommend VidSplitter with reservations. In the field of medicine a wide variety of medical devices are used. These include devices such as electrical leads, guides, tubes, catheters, cannulas, stents, and stent grafts. In

the field of medicine there are many different medical procedures that are used. These include, for example, those that treat cardiovascular disease. Such procedures include angioplasty, in which a balloon is used to enlarge the passageway. Other examples of interventional procedures include the use of stents to open blood vessels to promote increased blood flow. Still other examples of interventional procedures are the delivery of electrical leads to deliver electrical signals to cardiac

muscle tissue, to regulate heart rate, to stimulate muscle contraction to arrest the propagation of life threatening arrhythmias, etc. In each of these medical fields, there is a need for improved
