Web Development Most web designers use some sort of design software because design is a skill of its own, particularly when it involves creating websites for clients. It is not uncommon to find freelance web designers or web development companies in the United States that do not have any staff designers. Web design software enables you to create and manipulate HTML-based Web pages. It is important to create HTML and Web-safe graphics, and to then use these graphics in your Web pages. It is also important to create the HTML that is formatted in a way that makes the web page easy to read.

There are four web design software programs that are used by most web designers: Microsoft Frontpage, Macromedia Dreamweaver, Adobe Dreamweaver, and Adobe Fireworks. These are also the most popular. * _Microsoft Frontpage 2003_ (www.microsoft.com/frontpage) is one of the most popular programs for creating websites. It supports HTML, as well as other templates. * _Macromedia Dreamweaver_ (www.macromedia.com/support/dreamweaver/index.html) enables you to create and design web pages. It supports Web standards, and it is fairly easy to use. * _Adobe Dreamweaver_ (www.adobe.com/products/dreamweaver.html) is Adobe's web design software program. It supports most of the web standards and it is easy to use. * _Adobe Fireworks_ (www.adobe.com/products/fireworks.html) is a bit more robust than the other programs listed here, but it is not as easy to use.

As you become more comfortable with Elements, you might find that you are better off using the professional version because you can see more in the image. However, the downside is that Photoshop Elements can not be licensed for commercial use. If you are not a photographer or graphic designer, you don't need Photoshop and you would be better off using a different software package. Why Photoshop? Many people who use a computer to edit photographs are first taught in a programming

language like Java, PHP, or even C++, and then move on to Photoshop. Many people learn Photoshop as a second or third programming language, using some (often referred to as "Elements") as a version of BASIC, while others use it as their main programming language. Photoshop is a proprietary program, designed and written by Adobe. It is not open source as some other graphic editing applications are, and so it is the centre of controversy when talking about open source graphic applications. A distinction must be made between the open source nature of Photoshop itself (which is proprietary code written by the company which develops the program), and the open source nature of the source code of the additions and plugins which, with Photoshop, can be downloaded and added to the application (see the tutorial). The ability to modify the Photoshop source code and redistribute these modifications, without the requirements of a license or royalties is considered to be open source. Adobe has added a large number of quality plugins over the years and distributed them via the Adobe website. During this period they have been sold to other developers and companies so that many of the popular Photoshop extensions are now available as free software which people download, use and alter as they wish. Photoshop is widely used by professional designers and photographers. It is also one of the three main applications used in the production of some video games; one of the main factors in the success of the video game industry in recent years. It is also used by many web designers and web site developers as it offers a huge amount of editing and image processing tools to control aspects such as layers and images and also supports many different image formats. It has become quite a standard in digital image capture (via digital still cameras and scanners) and editing (such as on the desktop, laptop, tablet and mobile phone). It can be used not only to edit photographs but a wide variety of other images, from coloured photos to complex designs. Photoshop was originally bundled with older versions of the Macintosh operating system. It was 388ed7b0c7

Project Summary The proposed research will be a major advance in the study of the role of G protein-coupled receptors (GPCRs) in the regulation of fluid and electrolyte balance. The GPCR family, which consists of over 800 GPCRs, is one of the largest known families of mammalian protein receptors. In the kidney, ~50% of kidney and urine flow regulation occurs through the action of this family. Receptors are drug targets for ~60% of all FDA- approved drugs today; however, GPCRs are challenging targets to study due to their relatively low structural homology and large numbers. GPCRs are a diverse class of membrane proteins, defined by highly conserved structural motifs called GPCR domains. This family of domains includes intracellular loops, transmembrane (TM) domains, and extracellular (EC) domains. The ICL is the most variable region of GPCRs. The ICL domain is a stable unit that can be disassembled and re-assembled to modify the entire protein without changing function. The function of this disordered region is unclear. The TM domain is also unstructured and provides the primary component for ion transfer between the EC and intracellular compartments. The structures of the extracellular and cytoplasmic domains are much less conserved than the ICL and TM domains, and these domains are not required for function of GPCRs. This proposal will focus on the ICL domain and the TM domain. We propose to determine the 3D structures of the ICL and TM domains from native receptors, and determine how GPCR domains interact in G protein activation and GPCR-G protein signaling. We will also determine the 3D structures of GPCR domains in solution and in the context of the whole receptor. There is a disconnection in G protein research between the roles of TM domains in activation and signaling and the roles of the ICL and EC domains. Our long-term goal is to determine the structural characteristics of GPCR domains and their interactions that are essential for GPCR signaling. We will use two sets of GPCR domains to address these goals. The ICL domain (that forms the interface for G protein coupling), and the TM domain (that is the interface for ion transfer and signal transduction). The Heterotrimeric G Protein Alpha (G α , G β 13, G β 16, G γ 1/2) and Beta (G β
