Adobe Photoshop - The Software There are four main work areas: The Photo Browser The Layers palette The image window The history palette The Photo Browser The Photo Browser is where you start to select a photo. It shows a collection of images in various sizes and forms. The Photo Browser has the ability to manually crop an image; it lets you activate a zoom tool and select from various grid sizes. This view is also where you can put a vector image into a raster image and vice versa. Just the photo opens in a new window so you can have multiple canvases open at the same time. The Photo Browser can also be used to browse through your library of files that have already been opened up and modified. You also have the ability to set up automatic import from your camera. The Layers palette The Layers palette is where all image manipulation takes place. You can open this palette from the new window as well as a new image window. You can set up new layers, create a selection, mask and merge, turn layers on or off, convert an object into a new layer, and various other features. The image window This is where you edit your images. It is the same window in which you created the image. Within the image window there are other tools such as the zoom tool, the grid tool, and the fill tool. In addition to the tools, there are other edit windows of varying sizes and shapes. You can also have up to 20 windows open at once. The history palette The history palette is where you edit your images. This palette comes up whenever you open an image and its tools in a new window. Within this palette, you see all of your history editing, including how many you created, how many you deleted, and what kind of editing you've done. You also have buttons to go back and forward through all of your editing history as well as undo and redo features to save you time. In the upper right-hand side of the screen are the various tools and panels available to work with each image. The panels The panels are where all of the images editing takes place. The top layer panel The top layer panel shows you all of your current layers. You can create a new layer and add an image to a new layer by clicking on the new layer button, or you can select an image from the photo browser by double-clicking on the

Addition of a clickable link to a video makes the video more likely to be shared, according to new research, published this week in the Proceedings of the National Academy of Sciences. "The Find a Free Video on YouTube" button sits at the top of YouTube to make it easy for visitors to locate and watch a free, public-domain video. But some videos are "slow" to load or produce the sound of screeching tires—results that have led to millions of irritated YouTube users. A new method could help correct these quality problems for free. "Imagine a recording device that could be placed inside a birdcage and sense the songs that pass through the bars," notes Benjamin Huber, a Ph.D. candidate in the department of bioengineering at the University of California, Santa Barbara. "The device could wirelessly send those sounds back to your laptop computer as a recording." This recording-device-in-a-birdcage metaphor is no exaggeration. Huber has built a prototype of such a system, which uses an ultrasonic sensing technique that transmits and receives sound waves at different frequencies. These particular vibrations carry an image. But just as a picture in a music box can make an ordinary tune sound a little strange, a recording in that birdcage produces sounds that are both murky and distorted. Specifically, the recording presents the behavior of the ultrasonic vibrations from inside the bars as though it were coming from outside. Since the light bouncing off the ultrasonic waves has a wavelength that is much longer than that of the infrared radiation coming from the video, the only way to remove these distortions is to look at the audio image itself. In the new work, Huber shows that he can decode the image simply by measuring the speed at which ultrasonic waves echo back to their source. He then developed a technique for relating this speed to the image itself. When he ran a video of a birdcage with a transmitting device through his ultrasonic scanner, he found the video to be much clearer and more vivid. "The resolution is high enough to be able to make out faces in video," he says. "The spatial resolution is low enough so that you can clearly see the bars on the birdcage when looking at the video directly." The US National Science Foundation supported this work. 231 S.W.2d 642 (1950) CITY OF BEAUMONT v. JOHNSON et

! John Wiley & Sons, Ltd. 5. DISCUSSION [1] We successfully developed a cellular assay for the assessment of oral TKIs in the HT29 cell line that allows for rapid and convenient assessment of oral TKIs in a high-throughput format. Using a library of 30 oral TKIs, we demonstrated the utility of our assay with a HTSZD assay kit that can detect 17 TKIs by LC/MS/MS in 24 hours. When applied to the screen of our 30 TKIs, 23 compounds were found to be inhibitors, and seven compounds were found to be activators. Our results show that this assay can be easily and quickly used to assess the inhibition and activation of oral TKIs, and can aid in the prioritization of small molecules as potential drugs and aid in formulation of effective drug development strategies. Among the set of 30 TKIs, the inhibition/activation of eight TKIs was known, either from previous studies or from information available online ([20](#cts12477-bib-0020){ref-type="ref"}), [21](#cts12477-bib-0021){ref-type="ref"}] The IC₅₀ values of the other TKIs were in the ranges of 1–10 μM. Our assay was found to have the capability to recognize 11 of the remaining 22 TKIs and all five of the known activators in this study. We have previously reported the ability of the assay to detect emtricitabine, didanosine, entecavir, lamivudine, pyrovin, tenofovir, and zalcitabine.[7](#cts12477-bib-0007){ref-type="ref"}] The results for these 15 TKIs in the current study further demonstrate the utility of the assay and its ability to detect known TKIs as well as novel small molecules with activity. Of the novel TKIs, one was identified as a known inhibitor, [18](#cts12477-bib-0018){ref-type="ref"}], [19](#cts12477-bib-00
