The number of scientists in the United States earning a doctoral degree in pharmacology has decreased by more than 50% since 1974, according to an annual survey published online April 30 in PlosOne. Share Sponsored By Conducted by the National Institutes of Health, the National Institute on Drug Abuse and the National Science Foundation, the survey is meant to provide data about the size of the scientific workforce and the science enterprise. It found that, for the first time since the survey began in 1975, more than half of all pharmaceutically oriented doctoral degrees are awarded to students from just 12 programs. According to the online survey, 12 of these programs received 307 combined pharmacology and pharmacology-related doctorates in 2010, compared with a historical high of 145 combined degrees in 1975. While there are more than 70 pharmacology programs across the country, the survey only asked students

The first thing you need to look at is how you want to analyze your verbal data. The second thing you should do is to practice and analyze for an extended period of time to know how to beat your opponents. This invention relates to a "Measuring and Testing Device". A "Measuring and Testing Device" is disclosed in Austrian Pat. No. 175,398. This prior art device operates in the manner described below. Tape having a width of approximately 1.5 cm is wound onto a turning drum. A roll of tape is set onto a working section of a measuring unit wherein the position of the tape is scanned by sensors so that the tape can be threaded through a testing unit. The testing unit having a rotatable bearing on which there is provided a contact pad connected to a stop and another rotation-dependent contact pad, which together define the measuring unit. The disadvantage of the prior art device is that it can be used only for checking linear dimensions because the roll of tape and the stop mechanism form a linear measuring element. Accordingly, an object of the present invention is to provide a "Measuring and Testing Device" which is suitable for testing linear and angular dimensions as well as other measured values by means of a circularly moving and rotatable testing element, wherein the tape is wound around the testing element and back again. The first-mentioned object is attained in that the testing element is provided with a number of contact pads connected to sensors, which are arranged in such a manner that they can be moved into the position of test holes provided on a testing plate being attached to the measuring element, which plate covers the testing element. The test holes which are positioned under the contact pads will thus be read by the sensors and will indicate the value of the measuring element. The testing element being used in the present invention is preferably a plastic disk, the contact pads being provided on the side of the disk facing the testing plate or the testing element being provided on the testing plate. The measuring element, preferably a rubber roll, is preferably provided with a defined number of the test holes at a distance from each other in the axial direction, whereby with the testing element on the measuring element, the test holes of the measuring element will be in the position of the test holes on the testing plate. A measuring element being provided with test holes in its circumferential direction and test holes being aligned with a measuring element is also preferred. The contact pads are preferably in the form of light-emitting diodes
