Q: Finding integer solutions for equations of form  $n! = p^x q^y$  I am trying to find the integer solutions for equations of the form  $n! = p^x q^y$  where  $p$  and  $q$  are positive integers. For example, one solution to  $n! = 45^4 6^2$  is  $(30, 9)$ . I have looked at possible ways to prove that such solutions exist using knowledge I have gained from much harder problems in abstract algebra, but have been unsuccessful. I have also thought about the various techniques used to find integer solutions of equations of the form  $n! = a^b$ , such as Bertrand's Postulate, or the Chinese Remainder Theorem, but they also haven't led to any results. Is there some clever way of solving equations of this form without first explicitly reducing it to  $n! = ab$ ? Or does anyone have any ideas on where to start?

A: This should be much easier in this case.  $n! = p^x q^y \implies n = p^x q^y \implies (p^x, q^y)$  Bertrand's postulate gives  $p^{x-1} \cdot q^{y-1} \leq n < p^x \cdot q^y$  And the Chinese remainder theorem applies in this case, so that's a decomposition as you wanted.

Q: Generate url in java servlet for servlet mapping I have webapp (init.java & servlet) in this i want to set up new servlet mapping
