Organizing a Photoshop Image Before you start to edit an image, you need to know where the original version of the image is located. The way to find the original is to navigate to the folder where your images are stored, and look for a file called 'PSD'. You can also use the Organizer to select the image you want to edit. As an alternative to creating new layers and saving your work, you can open the Layers palette, and select an empty layer, which serves as a placeholder. If the image is open in Photoshop, it's likely that you'll see a layer named after the photo. ## Restoring a Saved Image Photoshop is designed to help you find your saved image after you've accidentally deleted it or closed the program without saving it. You can easily recover any saved image that you may have unintentionally deleted. Follow these steps to restore a file to its original state: 1. **Go to File** => **Save As** 2. In the Save As dialog box, navigate to the location where you want to save the image, and enter a new name in the File Name text box. Click **Save.** 3. **To use the original file, double-click the image to open it in Photoshop

This article will teach you how to use Photoshop Elements effectively, including tons of great tips, tricks and (more importantly) examples. Photoshop Elements, like traditional Photoshop, doesn't have a drag and drop interface like other graphical editing programs such as GIMP and Paint. Instead, it has a WYSIWYG Editor (What You See Is What You Get) with a flexible interface that encourages the user to create images the way they want. As such, some users prefer it to traditional Photoshop, while some photographers still prefer to work with traditional Photoshop. Moreover, the interface is much less daunting for beginners, so if you're just starting to use Photoshop, you should give Photoshop Elements a try. Q: How to check if the IP is in a network programmatically? I want to scan the IP (let's say 192.168.1.1 to 192.168.1.1000) and check if it is in the set of IPs that are in a certain subnet and if it's not found, I would like it to return false. Can this be done with a single C++ function or do I have to write a bunch of functions? A: C++ doesn't have a function to do that, but you can write one: #include <bool is_in_subnet(int ip, int subnet_start, int subnet_end) { int subnet_min = subnet_start + 1; int subnet_max = subnet_end - 1; for (int ip_min=0; ip_min
